

WAREHOUSING

Software Designed to Deliver

HI-TECH
FREIGHT
SOLUTIONS

Cyberfreight Warehouse is a fully integrated software suite. All accounting transactions are automatically processed in **Cyberfreight** Accounts avoiding the need for data re-entry or complex data transfer to an external accounts system. **Cyberfreight** runs on Windows and has a simple user interface. **Cyberfreight** Warehouse is fully configurable so that you can tailor the system to meet your needs.

The Web access gives your clients access to stock levels, account status and the ability to create sales orders.

Standard charges for storage, movements in and movements out can be configured for each client. In addition any number of miscellaneous charges can be posted. All charges are captured in the automatic billing process.

Cyberfreight has a small "footprint" meaning that you do not need powerful (expensive) hardware and networks.

You can invoice on your client's behalf, collect and bank money for them and even run all of their accounts. The powerful selling price structure allows you to cater for your clients' many price schemes and price specials. You can alert your clients to low and excessive stock levels, track stock by expiry date and batch numbers.

Cyberfreight Warehouse has interfaces to transport companies so that they can be notified electronically for pickups from your warehouse.

Key Features

- ✓ 3PL and 4PL
- ✓ Sales Order processing
